Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6355457

GENERAL INFORMATION:

APPLICANT: Ligon, James

APPLICANT: Ligon, James

APPLICANT: Ligon, James

APPLICANT: Ligon, James

APPLICANT: Ligon, James

APPLICANT: Ligon, James

APPLICANT: Cyr, Devon

APPLICANT: Goetlach, Joern

APPLICANT: Goetlach, Joern

TILLE OF INVENTION: GENES FOR THE BIOSYNTHESIS OF EPOTHILONES

FILE REFERENCE: 4.3058.A

CURRENT APPLICATION NUMBER: US/09/567,969

CURRENT APPLICATION NUMBER: 09/335,409

PRIOR FILING DATE: 1999-06-17

NUMBER OF SEQ ID NOS: 30

SEQ ID NO 1

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a fragment of GRAB protein from S. pyogenes strain SF370 corresponding to residues 34-174. This fragment is devoid of the trans-membrane and cell wall anchor regions. It is useful in vaccine composition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. Pyogenes strain API.

The protein has alpha2M binding region and is useful in vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a fragment of GRAB protein from S. pyogenes strain SF370 corresponding to residues 34-192 and devoid of the membrane spanning region. This fragment is useful in vaccine composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses a new family of proteins termed GRAB (protein G related alpha2b binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and poptides derived from it are used in vaccine compositions for generating a protective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,

The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. Pyogenes strain KTL3.

The protein has alpha2M binding region and is useful in vaccine
New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GRAB protein; protein G related alpha2M binding protein; vaccine; alpha2-macroglobulin; group A Streptococcus; GAS; antibiotic; immune response; Streptococcus pyogenes infection.

The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a full-length GRAB protein from S. pyogenes strain SF370.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GRAB protein; protein G related alpha2M binding protein; vaccine; alpha2-macroglobulin; group A Streptococcus; GAS; antibiotic; immune response; Streptococcus pyogenes infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 217;

                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus, pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a manture GRAB protein from S. pyogenes strain SF370 without the and useful in vaccine composition.
                                                                                                                                                                                                                                                                                                                                               New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,

The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. pyogenes strain AP49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytoplasmic, vaccine, prevention, treatment, infection, envelope, identification, binding compound, bacterium; life cycle, activator, bacteria, inhibitor, duodenal ulcer disease, chronic gastritis;

                                                                                                                                                                                                           The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is a lso useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. pyogenes strain KTL9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein \,

Sequence

888888**8** 

```
This sequence represents a H. pylori secreted or periplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori Infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori life cycle activators or inhibitors.

The sequence of H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori allowing the sequence of the pylori and lyse for of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ONF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORFs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least for treating or proteins are claimed, as are probes containing at least for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of the products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.

of Chiamydia trachomatis (see AA201425). The polypeptides can be used as vecines against chiamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chiamydia trachomatis is responsible for a large number of diseases, e.g. eye plaseases such as conventional trachoma, nonendemic trachoma, end inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venerallymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymetheotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymelectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations crasponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a number of nucleotide and protein acquences from the Corynebcerium Corynebcaterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and manyshing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium activity a particular of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, saccharides are useful for producing particularly Llysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                  Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Calcium/calmodulin dependent protein kinase; CaMK-VI; CaMK-IV; CaMK-VI related peptide; CARP; neuronal plasticity; epilepsy; kainate-induced selzure; selzure; central nervous system; hippocampus; acute brain insult; stroke; trauma; hypoxia; ischemia; neurodegenerative disease; Alzheimer's disease.

The AIBI protein is a member of the steroid receptor coactivator-1 (SCR-1) family of nuclear receptor co-activators that interact with estrogen receptors (FR) to enhance ER-dependent transcription.

The AIBI gene is amplified and over-expressed in certain cancers in particular breast cancer and steroid hormone responsive cancers. The AIBI polypeptide can be used to identify compounds which inhibit ER-dependent transcription. Increased expression of the AIBI gene indicates aberrantly proliferating cells, thus detection of increased expression of the AIBI gene or an increase in the number of copies of the AIBI gene or an increase in the number of copies of the AIBI gene can be used to diagnose cancer or a predisposition towards developing cancer. Compounds which inhibit carpoid receptors or nuclear co-factors can be used for reducing the proliferation of cancer cells. This sequence is of the murine pCIP protein, mouse ortholog of AIBI.
                                                                                                                                                                                                                                                                                                                                                                                    New isolated steroid receptor co-activator, AIB1 - used to develop products for the diagnosis and treatment of steroid-responsive
                                                                                                                                                                                                                                                                                                                                                                                                                            tumours, e.g. breast, lung, prostate or colon cancers or melanomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the amino acid sequence of the mouse p/CIP (p300/CBP/co-integrator-associated protein) polypeptide. The protein can regulate gene expression so are potentially useful therapeutically, e.g. against (breast) cancer, inflammatory disease (e.g. atherosclerosis)
                                                                                                                                                                         /note= "there appears to be 20 amino acids missing between these positions in the sequence given in the specification"
                                                                                                                                                                                                                                                      "there appears to be 20 amino acids missing
between these positions in the sequence given
in the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acids encoding p/CIP and NcoA-2 polypeptides - are used to identify agents that regulate gene expression, e.g. for treatment of cancer, inflammatory disease and osteoporosis

polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclocide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haemacopoiesis regulating activity, immunomodulatory activity and activity, inmunomodulatory activity and activity, inthe diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                            inilammation. Mote: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.

   The present sequence represents a protein from Streptococcus pneumoniae.

The nucleic acid sequence encoding the Streptococcus pneumoniae protein
can be useful in vaccines for inducing protective antibodies against
Streptococcus pneumoniae, for treatment or prevention of infection e.g.
care used to detect Streptococcus infection (by usual hybridisation or
amplification methods), also for isolating Streptococcus genes or their
calelic variants. The protein can be used similarly to detect specific
allelic variants and immunoassays, especially for diagnosing or
monitoring infections. Antibodies which bind the protein are used to
detect corresponding antigens, to purify the protein and for passive
immunisation (optionally coupled to a toxin). Vaccines are administered,
e.g. by injection, orally or through the skin, typically at 0.01-1000

AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antilifammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be useful as immunogens and/or antigens. The nucleotide sequences can be useful for the detection and diagnostis of S. pneumoniae. The protein sequences and interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitis. AAA05591 to AAA055614 represent primers used in the exemplification of the present invention.
                                                                                                                                                                                     New Streptococcal protein, useful as a vaccine, for diagnosis of pneumococcal diseases and for screening agents capable of antagonizing or inhibiting expression of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                       Gaps

The nucleic acid sequence is isolated from a human adult testes cDNA library using probe ANV61184. The polypeptide may have biological activities such has e.g. nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activity, and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour invasion suppressor activity, tumour inhabition activity or other activities.
                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   haematopoiesis regulating activity, tissue growth activity, activin, inhibin activity, chemotactic; chemokinetic activity, haemostatic; thrombolytic activity; anti-inflammatory activity; cadherin: tumour invasion suppressor activity; tumour inhibition activity.

```
(SCR-1) family of nuclear receptor co-activators that interact with estrogen receptors (ER) to enhance ER-dependent transcription.

The AIBI gane is amplified and over-expressed in certain cancers in particular breast cancer and steroid hormone responsive cancers in particular breast cancer and steroid hormone responsive cancers in particular breast cancer and steroid hormone responsive cancers.

The AIBI polypeptide can be used to identify compounds which inhibit ER-dependent transcription. Increased expression of the AIBI gene or an increase in the number of copies of the AIBI gene or an increase in the number of copies of the AIBI gene can be used to diagnose cancer or a predisposition towards developing cancer. Compounds which inhibit interaction of AIBI cancer calls. The PAS domain of the AIBI cancer cells. The PAS domain of the AIBI protein is a highly conserved domain among the SC-1 family of proteins. The ER-interacting domain of AIBI mediates binding of AIBI with a steroid hormone receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated steroid receptor co-activator, AIB1 - used to develop products for the diagnosis and treatment of steroid-responsive tumours, e.g. breast, lung, prostate or colon cancers or melanomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The AIB1 protein is a member of the steroid receptor coactivator-1
                                                                                                                                                                                                                                    AIB1; amplified in breast cancer; cancer; steroid; receptor coctivator; SCR; estrogen; ER; estrogen dependent transcribreast cancer; lung cancer; colon cancer; prostate cancer; melanoma; PAS region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4; Mismatches

These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Caryneform bacterium are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The AIB1 protein is a member of the steroid receptor coactivator-1 (SCR-1) family of nuclear receptor co-activators that interact with estrogen receptors (ER) to enhance ER dependent transcription. The AIB1 gene is amplified and over-expressed in certain cancers. The AIB1 polypeptide can be used to identify compounds which inhibit ER-dependent transcription. Increased expression of the AIB1 gene indicates aberrantly proliferating cells, thus detection of increased expression of the AIB1 gene or an increase in the number of copies of the AIB1 gene can be used to diagnose cancer or a predisposition towards developing cancer. Compounds which inhibit with steroid receptors or nuclear co-factors can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hormone response element; estrogen receptor alpha; neoplastic state.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an antisense oligonucleotide, targeted to a nucleic acid molecule encoding human steroid receptor coactivator-3 (SRC-3). The invention is useful for inhibiting the expression of SRC-3 in human cells or tissues in vitro. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is useful prophylactically, to prevent or delay infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound useful to prevent or delay infection, inflammation or tumor formation, specifically hybridizes with and inhibits the expression of human steroid receptor coactivator-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       coactivator; SCR; estrogen; ER; estrogen dependent transcription; breast cancer; lung cancer; colon cancer; prostate cancer;

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01019, expressed DNA sequences (ABL01019, expressed DNA sequences (ABL01019, O-ABL16175) and the encoded proteins
                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions - \frac{1}{2}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Labeled polypeptide binding partner compositions useful for monitoring protease activity by detecting signal modulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Coiled-coil; yeast; GCN4; general control of nitrogen; protease; caspase; assay; signal modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This represents a human steroid receptor coactivator-3 (SRC-3). Host cells transformed with vectors comprising the SRC-3 gene can be used for the recombinant production of the SRC-3 protein. SRC-3 can be used to enhance the transcription of genes, which are regulated by hormone response elements, e.g. estrogen receptor alpha. SRC-3 can be used in methods to screen for compounds that bind to SRC-3 or which modulate formation of SRC-3 transcription complexes. Determining the amount of SRC-3 in a sample is also useful in a method to detect overexpression of SRC-3 and therefore determining the neoplastic states of cells in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                The present sequence is that of a homomeric coiled-coil domain derived from amino acids 249-281 of Sarcharomyces cerevisiae GCN4 (general control of nitrogen). The native GCN4 sequence was modified to include a caspase site. A polypeptide useful in the present invention is capable of multimerising with similar or different polypeptides. The polypeptide requires a binding domain, such as a coiled-coil domain, which allows multimerisation. The nultimer preferably comprises a first polypeptide associated with a label and a second polypeptide, where (a) at least 1 of the polypeptides to form a multimer is detectable via a signal emitted by the signal, and (c) digestion of at least 1 polypeptides results in dissociation of the multimer and modulation of the signal emitted by the label. The multimer is used to monitor the activity of a protease. In an example of the method, the polypeptide caspase assay, with the signal analysed by fluorescence resonance

```

The present sequence is shorthorn sculpin skin-type antifreeze protein

```
ö
(sssAFP-2) encoded by cDNA clone s3-2. The AFPs are alanine-rich polypeptides that are synthesised in the peripheral tissues, such as skin and gills, and serve to depress the freezing temperature of intracellular fluids. The AFPs are used to make aqueous compositions resistant to freezing, to improve the cold tolerance, for inhibiting ice recrystallisation, and for stabilising biological membranes. They are also used to improve the shelf life and food quality of many refrigerated foods and have antibacterial properties. This has many useful applications in medicine, agriculture and aquaculture.
